

FRAUD INTELLIGENCE CONSOLE

How to sign in, submit a transaction, and read the result.

A short guide for anyone using the console for the first time – where to sign in, which account to use, how to submit a transaction for scoring, and how to read what comes back.

CONSOLE (START HERE) fe-fraud-detection-system.vercel.app	API REFERENCE (TECHNICAL) fraud-detection-system-fmh3.onrender.com/docs
---	--

RUNNING ON

VERCEL – CONSOLE	RENDER – API	NEON – DATABASE	UPSTASH – CACHE & QUEUE
----------------------------------	------------------------------	---------------------------------	---

01 – OPEN THE CONSOLE

Getting in

Open the console in a browser at the address below. No installation is needed.

CONSOLE LINK

<https://fe-fraud-detection-system.vercel.app>

02 – SIGN IN

Your account

Enter your email and password on the sign-in screen. There is nothing else to fill in – the console works out what you are allowed to see from your account alone.

ACCOUNT	PASSWORD	TEAM	WHAT IT CAN DO
analyst@example.com	SyntheticDemo!2026	team-alpha	Review and triage cases
supervisor@example.com	SyntheticDemo!2026	team-alpha	Everything an analyst can, plus close cases and see every team
other-analyst@example.com	SyntheticDemo!2026	team-beta	Review and triage cases for team-beta
admin@example.com	SyntheticDemo!2026	–	Create and manage user accounts only

Sample data only. Every account and every case in the console is synthetic – none of it is a real customer or a real transaction.

03 – FIND YOUR WAY AROUND

The three places you'll use

1 Dashboard

A summary of what's happening – how many transactions came in, how many were flagged, and what needs attention.

2 Alerts

Every case the system has flagged, with the newest and highest-risk ones easy to find.

3 Transactions

Where you submit a transaction to be checked, and see the result.

04 – THE TWO HALVES OF ONE FLOW

Submitting and scoring

Checking a transaction has two parts, run by two separate system connections. You operate the first one; the second one runs on its own the moment you submit – together they are what makes the flow complete.

CONNECTION ID	CONNECTION KEY	ROLE	WHO USES IT
ingest-loader	demo-ingest-secret-not-for-production	Submits a transaction to be checked	You, from the console
ml-service	demo-ml-secret-not-for-production	Scores the transaction and returns a result	The system, automatically

You only ever type in the ingest-loader details – the ml-service connection is shown here so the full picture is documented, not because you operate it by hand.

05 – SUBMIT A TRANSACTION

Step by step

- 1

Open Transactions
Click **Transactions** in the top menu.
- 2

Open the connection
Enter the ingest-loader ID and key from the table above, then click **Open ingest session**.
- 3

Choose a sample, or fill in the details
Use **Load sample** for a ready-made example, or fill in the amount, accounts and other details yourself. Anything missing or incorrect is pointed out before you submit.
- 4

Submit
Click **Submit transaction**. The result appears on the same page – scoring typically completes within a second or two.

06 – READING THE RESULT

What you'll see

A result card appears under the form as soon as the transaction is submitted. One of three things has happened:

RESULT	WHAT IT MEANS
STORED & SCORED	The transaction was checked immediately. A risk score and result are shown right away – this is the normal outcome.
SCORING IN PROGRESS	The transaction was accepted and is still being checked. The console keeps watching and fills in the score automatically once it's ready – no action needed from you.
ALREADY SUBMITTED	If the same transaction is sent twice, the console recognises it and shows the original result again rather than checking it a second time.

07 – THE SCORE ITSELF

Three things to look at

1 Risk percentage

A single number from 0% to 100%. Above 70% raises a case for review automatically.

2 Risk band

LOW MEDIUM HIGH / CRITICAL – a plain-language version of the percentage.

3 Case link

If a case was raised, an **Open case** link appears. It takes you straight to the full case file – why it was flagged, and a place to record what you decide.

Where to check on it later. Every flagged transaction also shows up in **Alerts**, so you don't need to keep this page open – you can always come back and find it there.

What this runs on

Nothing here needs any action from you — it's included so anyone technical looking at this guide knows what they're pointing at.

SERVICE	ROLE	ADDRESS
VERCEL	Hosts the console — the screen you sign in to	fe-fraud-detection-system.vercel.app
RENDER	Hosts the API — everything the console talks to behind the scenes	fraud-detection-system-fmh3.onrender.com
NEON	Stores every account, transaction and case — Postgres database	—
UPSTASH	Fast in-memory cache and job queue used while scoring	—
